1. Ontological design

This section is going to break down from minor to major detail the design of the ROH ontology network. Starting in section 1 with a high-level diagram, the most important entities will be shown. Then, the main entities modelled are broken down (sections 1.3 to 1.8). Before, the following table shows a summary of the reused ontologies together with their respective user licenses. All reused ontologies have been evaluated for compatibility with their import and extension.

prefix	Ontology names	License	Ontology website

1.1. Conceptual diagram of ontology ROH

Figura 1 shows the main entities modelled in the Hercules Ontology Network (HON in English, ROH-Red de Ontologías Hércules in Spanish). Note that in the diagram, the arrows with a filled tip denote kinship (inheritance) relationships while the arrows that end in a non-filled tip indicate that there is an Object Property relationship between these entities. Finally, the dashed arrows reflect the fact that several entities in ROH have geographic (class Geonames:Feature) and temporal (class vivo:DateTimeInterval) constraints.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

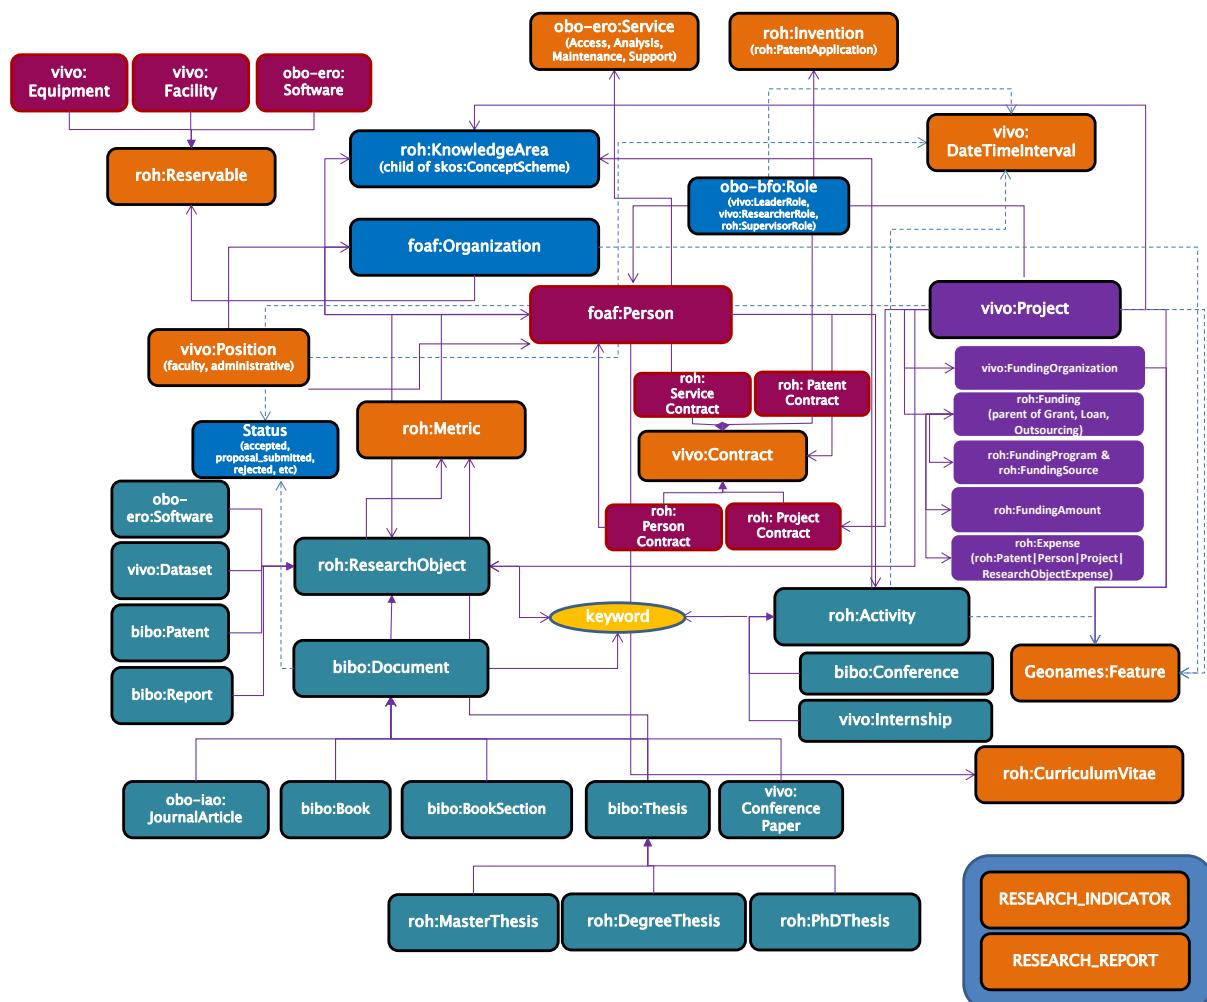

Figura 1. High level diagram of ROH –Red de Ontologías Hércules.

1.2. Modules in ROH network of ontologies

The following table lists all ontologies created, which combine entities defined specifically in our core ontology under prefix roh with those reused from other well-known and extensively adopted ontologies. Notice that ROH network of ontologies is divided into 2 main parts as depicted in the following figure:

- The generic ontology, **core module**, contains the most important entities and properties to model information in the academic domain. It contains the central part of the network of ontologies. It covers the academic domain, being agnostic to the country or the research organization whose information wants to be modelled with.
- A set of **vertical modules** which include, on one hand, specializations of some academic concepts for a given country domain. For instance, the figure Associate Professor in the Spanish academic

Página 4 de 35

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

domain would be encountered in the vertical module university-HR-es and is assigned the URI <http://purl.org/roh/university-hr/es#ProfesorTitularDeUniversidad>. On the other hand, these vertical modules, include controlled vocabularies, according to SKOS ontology, for different important areas in the academic domain, namely, geographical locations (geopolitical), knowledge areas (including concepts for scientific-domains, subject-areas or unesco-codes), classification of project types (project-classification), resource positions in universities (university-HR for Spain, UK or Portugal), controlled vocabulary with all universities in Spain (university-structure) or some extensions for the Spanish university system (extensions-es).

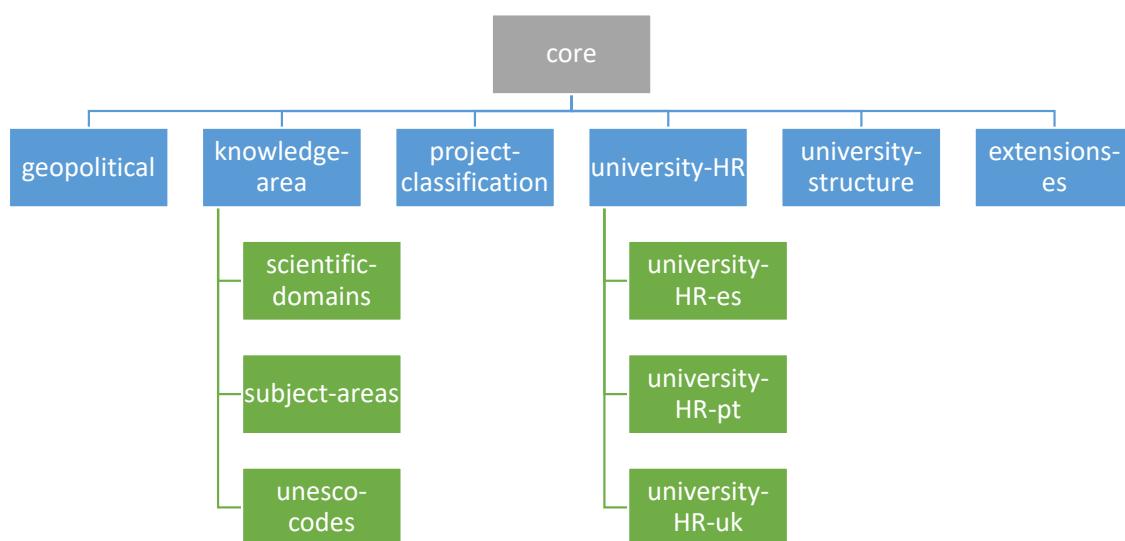

Figura 2. Hierarchical module structure of ROH network of ontologies.

1.3. Entity Project

The main ROH entity is `vivo:Project` (see Figura 3), a new entity defined within ROH. In ROH, a Project models a collaborative activity in business and science that often involves research or design and is carefully planned to achieve a particular goal. Its configuration is inspired by the `swrc:Project` and takes into account the data properties of the `cerif:Project` and `vivo:Project`. It comprises all those properties and adds some new ones, for example, `roh:projectStatus`, `roh:modality` or `roh:title`.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

It includes the Data Properties `roh:identifier`, `vivo:abbreviation`, `vivo:description`, `roh:title`, `vivo:freeTextKeyword`, `roh:modality`, `roh:foreseenJustificationDate`, `roh:projectObjective` and `roh:needsEthicalValidation`.

An `vivo:Project` includes a property `roh:hasKnowledgeArea` which allows to associate a project with different instances of knowledge areas, e.g. instances of `skos:Concept` belonging to `roh:UNESCOKnowledgeArea` controlled vocabulary or concept scheme. Besides, it allows a project also to be classified (`roh:hasProjectCategorization`) according to the project categories defined in hierarchy defined under the concept scheme `roh:ProjectClassification`, e.g. <http://purl.org/roh/project-classification#Horizon2020>. Likewise a project might be associated to the recruitment of a new human resource, in that case `roh:hasHRClassification` allows to link a project with a `roh:HumanResourceClassification`. A project may go through different stages, i.e. `roh:projectStatus` during its lifetime, e.g. `roh:Open`, `roh:ProposalSubmitted`, `roh:Rejected` or `roh:Closed`.

Besides, an instance of a `vivo:Project` is associated to the following entities through object properties:

- `roh:Activity` is `roh:participatedBy` a project, describes what activities a project participates in.
- `skos:Concept` is linked through `roh:knowledgeAreaOf` to a project, indicating the topics/concepts a project deals with. A project may be classified according to distinct taxonomies (concept schemes) for `roh:ProjectClassification` and `roh:HRClassification` (human resources).
- `roh:Dossier` through relationship `vivo:relates` binds a set of documents, including the proposal, evaluation document, reports and so on with a `vivo:Project`. A dossier is an administrative file collection in which all assets related to a Project are stored, including the Research Proposal, approval documents, viability plans and so on associated to a project are stored.
- `roh:Funding` `roh:supports` a `vivo:Project`, where funding `obo-ro:BFO_0000051` (has part) `roh:FundingAmount`. A `roh:FundingAmount` `roh:grants` `foaf:Organization`

Página 6 de 35

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

and describes the details about the funding associated to a project, in what period and what organization it funds. A `roh:FundingSource` is `roh:promotedBy` a `vivo:FundingProgram` which is `roh:promotedBy` a `vivo:FundingOrganization`. `foaf:Organization`, where different organizations may play different `obo-bfo:Roles` in a project, e.g. `vivo:MemberRole` or `vivo:AdministratorRole`. Notice that the object property `vivo:relates` allows to link a `foaf:Agent`, being it either an `Organization` or a `Person`, with an `obo-bfo:Role`.

- `roh:Justification` through relationship `vivo:relates` binds justifications with a `vivo:Project`.
- `foaf:Person`, where an person may play different `obo-bfo:Roles`, e.g. `vivo:PrincipalInvestigatorRole` or `vivo:ResearcherRole`.
- `vivo:ProjectContract` subtype of `vivo:Contract`, a project may be associated to a contract through relationship `roh:hasContract`.
- `roh:ProjectExpense` is `roh:spentBy` a project, details allows to associate a project with its expenses.
- `roh:ResearchObject`, where a project `roh:produces` several `roh:ResearchObject`, where some results of a project might be for example of types `bibo:Journal`, `obo-ia:JournalArticle`, or `roh:PhDThesis`.

Notice that a `vivo:Project` may also be part (`obo-ro:BFO_0000051`) of another project, e.g. child of a parent project. Besides, every instance of a `vivo:Project` is time bound by being associated with an instance of `vivo:DateTimeInterval` and geographically bound to an instance of `gn:Feature` (through relationship `gn:locatedIn`).

The following table shows the object and data properties associated to `vivo:Project`:

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Project Model 12 March 2021

Notice that different Projects categorizations may exist, binding a project through roh:hasProjectCategorization with a roh:ProjectClassification, e.g. roh:European.

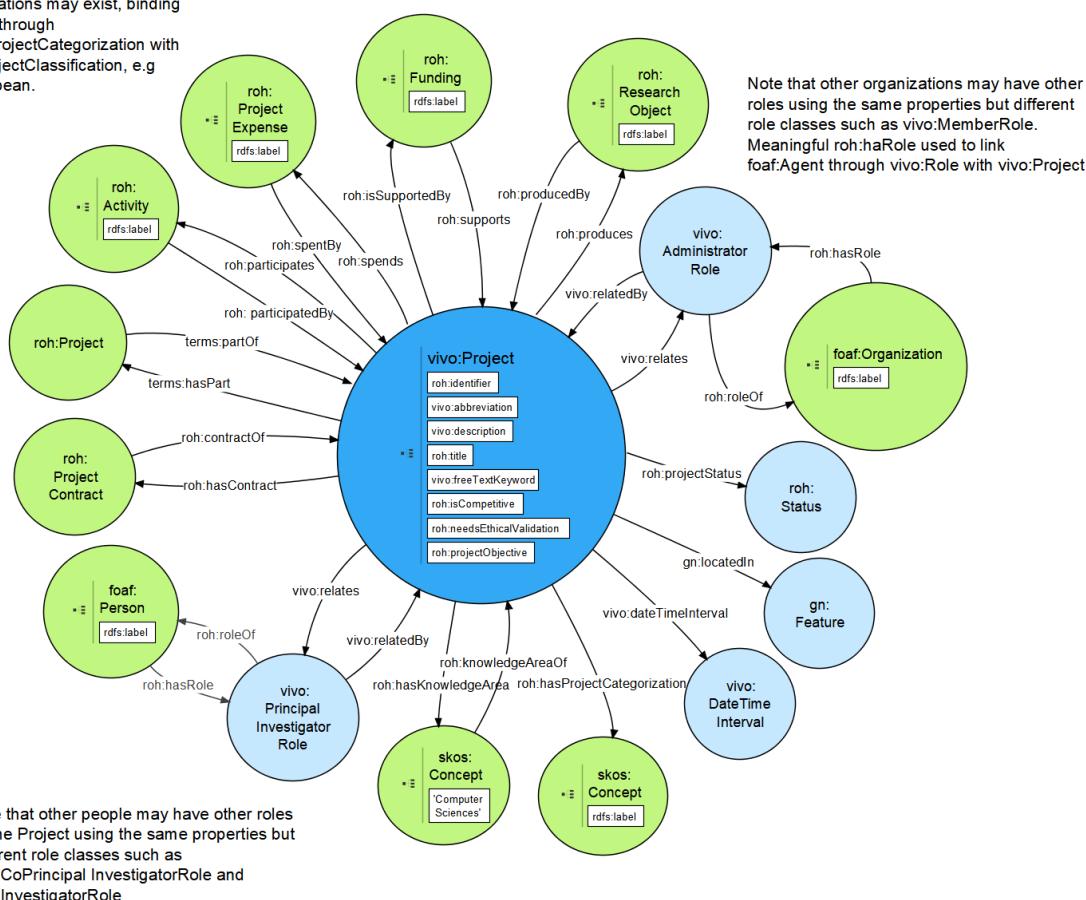

Figura 3. Ontological diagram for entity Project.

1.4. Entity Person

In ROH, there is a **foaf:Person** entity (see Figura 4) that inherits from **foaf:Agent**. The specialization of this entity imported from the VIVO ontology already adds some **Data Type** properties of the research domain, but in ROH we also incorporate **roh:taxID**, **roh:ORCID**, **vivo:researcherId** or **vivo:scopusId** (all of them are subtypes of **vivo:identifier**, a given person may use or several alternatives of those identifiers) and also several object specific properties of the research domain as "has a Role" (**roh:hasRole**) in an Organization, "has a CurriculumVitae" (**roh:hasCV**), "has some

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

"Accreditations" (`roh:hasAccreditation`), "has an Employment Contract" (`roh:hasContract`), "has some Knowledge Areas" (`roh:hasKnowledgeArea`) or "has some Roles" (`roh:hasRole`) in Projects or participates through "`bibo:authorList`" with Research Objects of subclass `bibo:Document`. A person can "have different roles" in the Project over time. As a subclass of `foaf:Agent` inherits some additional object properties such as `roh:hasAccreditation` or `roh:hasContactInfo`.

As mentioned above, `foaf:Person` in ROH is based on FOAF (Friend of a Friend [2], following patterns used in VIVO. That explains why it includes some of the basic FOAF properties such as `foaf:name`, `foaf:nickname`, `foaf:title`, `foaf:mbox` (note that this in fact an object property), `foaf:img` (note that this in fact an object property), `vivo:description`, `foaf:firstName` and `foaf:surname`. However, it considers all attributes and links defined in CERIF through the `cfPers` entity. `foaf:Person` incorporates the following data properties declared as attributes in `cfPers`, especially: identifier (`vivo:identifier` but preferably `roh:ORCID`), `roh:birthdate`, `foaf:gender`, `foaf:homepage` (note that this in fact an object property), `roh:researchLine`, `vivo:freeTextKeyword`. Some important CERIF relationships that have also been adopted: Curriculum Vitae (`roh:hasCV`) which links `foaf:Person` with `roh:CurriculumVitae`, Event (`roh:Activity`) and Indicator (`roh:Accreditation`).

Besides, an instance of a `foaf:Person` is associated to the following entities through object properties:

- `roh:AuthorMetric`, where a researcher may have associated metric values such as h-index or i10 index.
- `roh:AcademicSubject`, where a researcher teaches different subjects.
- `vivo:AwardedDegree`, where a researcher `vivo:relates` with an `roh:AcademicDegree`
- `roh:Accreditation`, where a researcher `roh:hasAccreditation` of different types, e.g. `roh:ResearchAccreditation` or `roh:AcademicAccreditation`.
- `roh:Activity`, where a researcher `roh:participates` in diverse activities, e.g. `vivo:InvitedTalk` or `bibo:Conference`.
- `skos:Concept` is linked through `roh:knowledgeAreaOf` to a person, indicating the different knowledge areas (`roh:KnowledgeArea`) a researcher is specialized on.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

- `roh:CurriculumVitae`, where a researcher `roh:hasCV` which includes a data type property like `roh:summary`. A researcher is also bound to author metrics `roh:AuthorMetric` through property `roh:hasMetric`.
- `bibo:Document`, `roh:ExperimentalProtocol`, and `obo-ero:ERO_0000071(Software)`, where a researcher through `roh:seqOfAuthors` is participating in a `bibo:Document`, `roh:ExperimentalProtocol` or `obo-ero:ERO_0000071(Software)` as one of its authors. In the case of `bibo:Document` the object property `bibo:AuthorList` also can be used.
- `vcard:Individual`, where a researcher `roh:hasContactInfo` described through ontology `vcard`.
- `vivo:Position`, where a researcher `roh:hasPosition` usually in an organization linking it to any of the `vivo:Position` subclases like `vivo:FacultyAdministrativePosition` or `vivo:FacultyPosition`.
- `vivo:PersonExpense`, where a researcher may contribute with several expenses for its research activities.
- `roh:ResearchObject`, where a researcher is the `roh:correspondingAuthor` of different subtypes of `roh:ResearchObject`, e.g. `obo-iao:JournalArticle`, `vivo:ConferencePaper` or `bibo:Proceedings`.
- `obo-bfo:BFO_0000023` (Role), where a `foaf:Agent` may `roh:hasRole` like `vivo:ResearcherRole` or `vivo:TeacherRole` either in a `vivo:Project` or a `foaf:Organization`.
- `roh:PersonContract`, where a researcher `roh:hasContract` described according to the attributes corresponding to parent class `vivo:Contract`.
- `bibo:Thesis`, where a researcher is `roh:supervisorOf` of a `bibo:Thesis`, concretely, any of its subtypes subclases like `roh:MasterThesis` or `roh:PhDThesis`.

The following table fully describes the object and data properties defined within the `foaf:Person` entity in ROH.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

Figura 4. Ontological Diagram for entity Person.

1.5. Organization entity

An Organization in ROH (see Figura 5) is a *foaf:Organization* which carries out several *vivo:Project*. It is a child of *foaf:Agent*. Some organization can emit *roh:Accreditation* (e.g. ANECA or CENAI in Spain), those belonging to subclass *roh:AccreditationIssuer*, or award degrees (*vivo:AwardedDegree*), those of subclass *vivo:University*. An Organization may receive several *roh:FundingAmount*, corresponding to a *roh:Funding*, obtained through a *roh:FundingProgram* provided by a *vivo:FundingOrganization* through a *roh:FundingSource*. As a *foaf:Agent* an Organization may be involved in several *roh:Actitivity*, has several instances of attribute *vivo:freetextKeyword*, is associated through *roh:hasKnowledgeArea* with *roh:KnowledgeArea* and bound to a geographical scope through *gn:locatedIn* with *gn:Feature*, it may also have a time span through *vivo:dateTimeInterval* linking it with an instance of *vivo:DateTimeInterval*.

Based on FOAF [10], the *foaf:Organization* entity takes into account the data properties (attributes: *vivo:abbreviation*, *foaf:homepage*) and data properties (links) defined by

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

the Organization Unit in CERIF. It also takes into account and supports the relationships of CERIF Equipment (via entity vivo:Equipment and object property roh:hasReservable), Event (roh:Activity), Expertise and Skill (via vivo:freeTextKeyword and roh:hasKnowledgeArea), Facility (roh:Facility and roh:hasReservable), Funding (roh:Funding), Organization Unit (kinship relationships between organizations can be established with obo-ro:BFO_0000051 (has part) and obo-ro:BFO_0000051 (part of), Prize Award (through roh:Accreditation), Result Patent, Result Product, Result Publication and Service - all of them through roh:ResearchObject which can be obtained through the roh:produces relationship from the Projects in which an organization participates by playing a declared role through roh:hasRole, Person (through roh:hasPosition). Therefore, the CERIF data model for Organization is covered.

An exhaustive hierarchy of organizations is included, e.g. roh:AccreditationIssuer, vivo:Company or vivo:University, among many others.

Besides, an instance of a foaf:Organization is associated to the following entities through object properties:

- roh:Accreditation, where an organization of type roh:AccreditationIssuer issues (roh:issues) accreditations, e.g. roh:ResearchAccreditation or roh:AcademicAccreditation.
- roh:Activity, where an organization may play vivo:OrganizerRole through roh:hasRole in an activity or may through its participation role in a project participate (roh:participates) in an activity.
- vivo:AwardedDegree, where a vivo:University may roh:awards degrees which are related to both a concrete vivo:AcademicDegree and an instance of foaf:Person.
- skos:Concept, where an organization through roh:hasKnowledgeArea may be associated to several knowledge areas, defined as instance data of thesaurus created with SKOS ontology. A concept linked to an organization must necessary belong to roh:KnowledgeArea concept scheme.
- vivo:Company, where an organization might be linked to several spinoffs through object property roh:hasSpinOff.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

- vivo:DateTimeInterval, where an organization may exist during a given time interval
- foaf:Document, where an organization may be associated to several homepages foaf:HomePage
- gn:Feature through relationship gn:locatedIn, where an organization may be associated a geographical scope.
- roh:FundingAmount where an organization may receive several funding amounts part of a roh:Funding through roh:grants object property.
- vcard:Organization, where an organization roh:hasContactInfo described through ontology vcard.
- roh:PatentApplication or bibo:Patent where an organization is the owner (roh:ownerOrganizationOf) of different patent applications or granted patents. Notice that a roh:PatentApplication goes through different status (roh:patentStatus) and is associated with a granted patent (bibo:Patent), once its status passes to be roh:Accepted, through object property (roh:hasPatent).
- roh:Reservable, where an organization may roh:hasReservable, belonging to any of its subclasses, e.g. roh:Equipment, roh:Facility or obo-ero:ERO_0000071 (Software).
- foaf:Organization, where a foaf:Organization may be linked through vivo:hasSuccessorOrganization or vivo:hasPredecessorOrganization with another foaf:Organization or may be part of (obo-ro:BFO_0000050 (part of)) or include (obo-ro:BFO_0000051 (has part)) other several foaf:Organization.
- obo-ero:ERO_000005 (Service), where an organization roh:provides several services, e.g. obo-ero:ERO_0000392 (Storage Service)
- roh:ResearchObject, where a foaf:Organization may be linked through roh:correspondingOrganization with some roh:ResearchObject.

Check the following table for more details on object and data properties for foaf:Organization.

Una manera de hacer Europa

Figura 5. Ontological diagram for entity Organization.

1.6. Funding entity

The roh:Funding entity (see Figure 6), new in ROH, represents the funding associated with a project (vivo:Project) whose funding is associated with a funding program (roh:FundingProgram) and comes from a (roh:FundingSource), which in turn is associated with a funding organization (vivo:FundingOrganization). A funding is divided into several amounts (roh:FundingAmount), associated with the different entities that participate in a project and the annuities in which they do so. Funding amounts for an organization in a projects are expressed through data properties roh:monetaryAmount and roh:currencty.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

A funding can be marked as public through property `roh:publicFunding`, qualified by properties `vivo:identifier`, `vivo:description` and `vivo:freeTextKeyword` and classified into `roh:Grant`, `roh:Loan`, `roh:Outsourcing` or `roh:RefundableAdvance`.

The funding organization (`vivo:FundingOrganization`) (see Figure 6), imported from VIVO [1], inherits from `foaf:Organization`, promotes (`roh:promotes`) research through different funding programs (`roh:FundingProgram`) and through different funding sources (`roh:FundingSource`). A `roh:Funding` is associated with `roh:FundingAmounts` through object property `obo-ro:BFO_0000051` (has part). A `roh:FundingProgram` funds (`roh:funds`) a `roh:Funding`, funding programs are promoted by `roh:FundingOrganizations`. Notice that a `roh:Funding` is divided into several `roh:FundingAmounts` associated with different `foaf:Organizations` through the `roh:grants` relationship.

The Funding Program entity (`roh:FundingProgram`) (see Figure 6), new in ROH, defines the funding initiatives promoted (`roh:promotedBy`) by a Funding Organization (`roh:FundingOrganization`) which is, likewise, promoted by a `roh:FundingSource`. A funding is in operation during a time interval (`vivo:dateTimeInterval`) and is usually linked to a geographical scope (`geonames:Feature`) associated to the `roh:FundingProgram`.

The following table illustrates the object and data properties associated to entities dealing with the funding concept in ROH.

Funding Model
12 March 2021

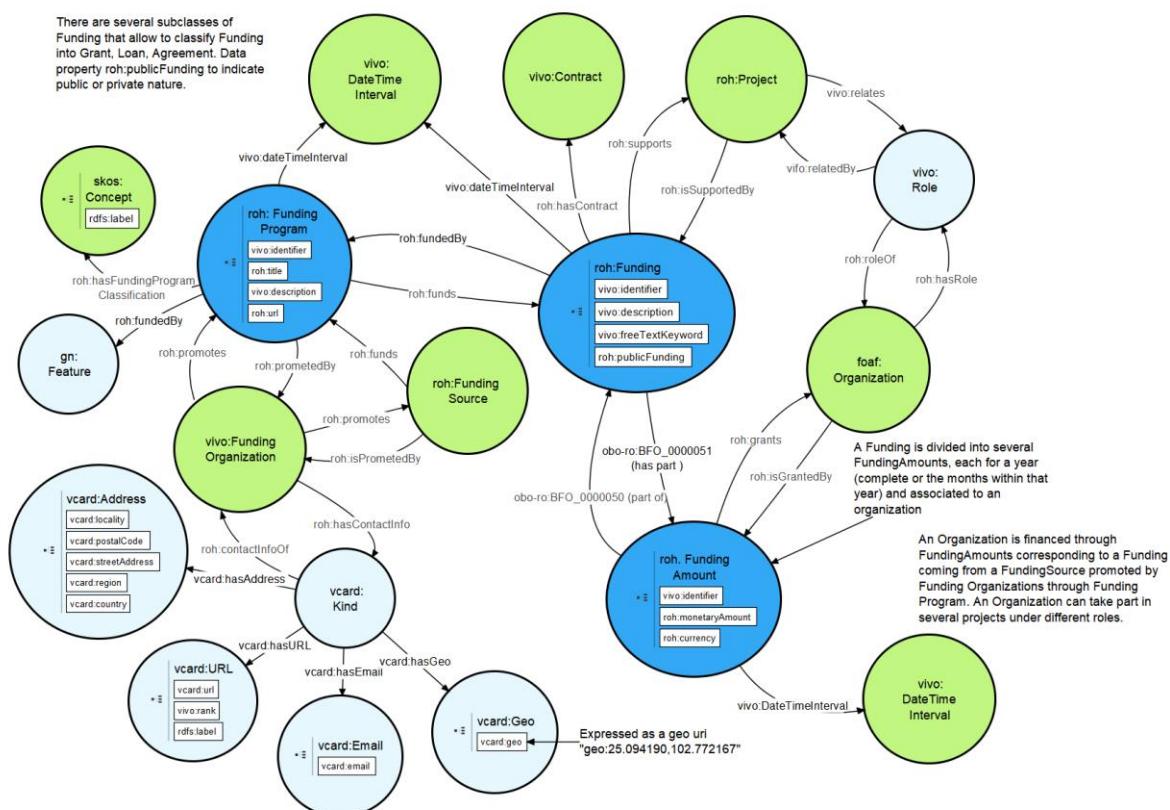

Figure 6. Ontological diagram for Funding.

1.7. Research Result and Research Object Entities

The research object entity (`roh:ResearchObject`) is a new entity defined in ROH that corresponds to a research result (`roh:ResearchResult`) generated by a person (researcher), usually through work on a project. Notice that `roh:ResearchObject` is a subclass of `roh:ResearchResult` and a defined class, which follows these restrictions: ('part of research result' some 'Research Result') or ('produced by' only `vivo:Project`). This is, an instance in ROH belongs to class `roh:ResearchObject` if it meets these restrictions. Usually a `roh:ResearchObject` results from working on a `vivo:Project` (`roh:produces`), which is modelled with the

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

second constraint ('produced by' only vivo:Project). Regarding the first restriction, an instance of ero:software, bibo:Document and roh:ExperimentalProtocol is a research object only if this instance is part of (roh:partOfResearchResult) some roh:ResearchResult declared by some researcher. Thus, each roh:ResearchResult and the roh:ResearchObjects that compose it are specific to the author who creates the research result and declares its elements. So, if an article is created by two researchers, one of them can declare it as a research object making this article part of his research result, while the other researcher can not declare it if he does not want to.

A research object has been modelled, around entities obo-iao: IAO_0000030 (Information Content Entity), roh:ExperimentalProtocol, and obo-ero:ERO_0000071. Such entities are linked to at least one foaf:Person through object property roh:correspondingAuthor. The contributors of a research object are accessible through object property roh:seqOfAuthors, or in the case of bibo:Document (subclass of obo-iao: IAO_0000030 (Information Content Entity)) the contributors are also accessible through object property bibo:authorList. The primary author of a research object is accessible through the roh:correspondingAuthor property and the responsible organization of a research object is accessible through roh:correspondingOrganization. A roh:ResearchObject may have several knowledge areas bound to it through roh:hasKnowledgeArea, where the linked concepts should be associated to concept scheme roh:KnowledgeArea or one of its subclasses. The vertical module knowledge-area contains relevant instance data scientific domains, research subjects and UNESCO codes.

1.7.1. obo-iao: IAO_0000030 (Information Content Entity) Entity

Under obo-iao: IAO_0000030 (Information Content Entity) entity a complete taxonomy of entities mostly imported from BIBO [4], covering all kinds of publications, patents, and web pages, is defined. Some examples are: bibo:Collection, bibo:Journal, bibo:Article, bibo:Book, bibo:Chapter, vivo:DataSet, bibo:Patent, bibo:Thesis and bibo:Webpage.

The concept publication it's the most important and is defined mainly through the imported entity bibo:Document. Currently, the following sets of entities related to the publication concept are supported: bibo:Collection (Newspaper, Magazine) and bibo:Document (Article, ConferencePaper, EditorialArticle, Book, Proceedings, ConferencePaper, Chapter, Thesis). bibo:Thesis has been refined into roh:BachelorsThesis, roh:MastersThesis and roh:PhDThesis.

Two entities worth mentioning that belong to the hierarchy of classes associated to the vivo:Project are: bibo:Report and roh:Dossier. A bibo:Report has been refined to include subclasses roh:EthicalReport (which includes roh:EthicalAudit and roh:EthicalValidation), roh:EvaluationSummary, roh:Justification and roh:ResearchProposal. This implies that a report may correspond to ethical validation and auditing needs of a project, correspond to the evaluation of the project, its proposal or the set of documents corresponding to its justification. On the other that represents a collection of reports related to a vivo:Project, which may include all the types of reports above mentioned.

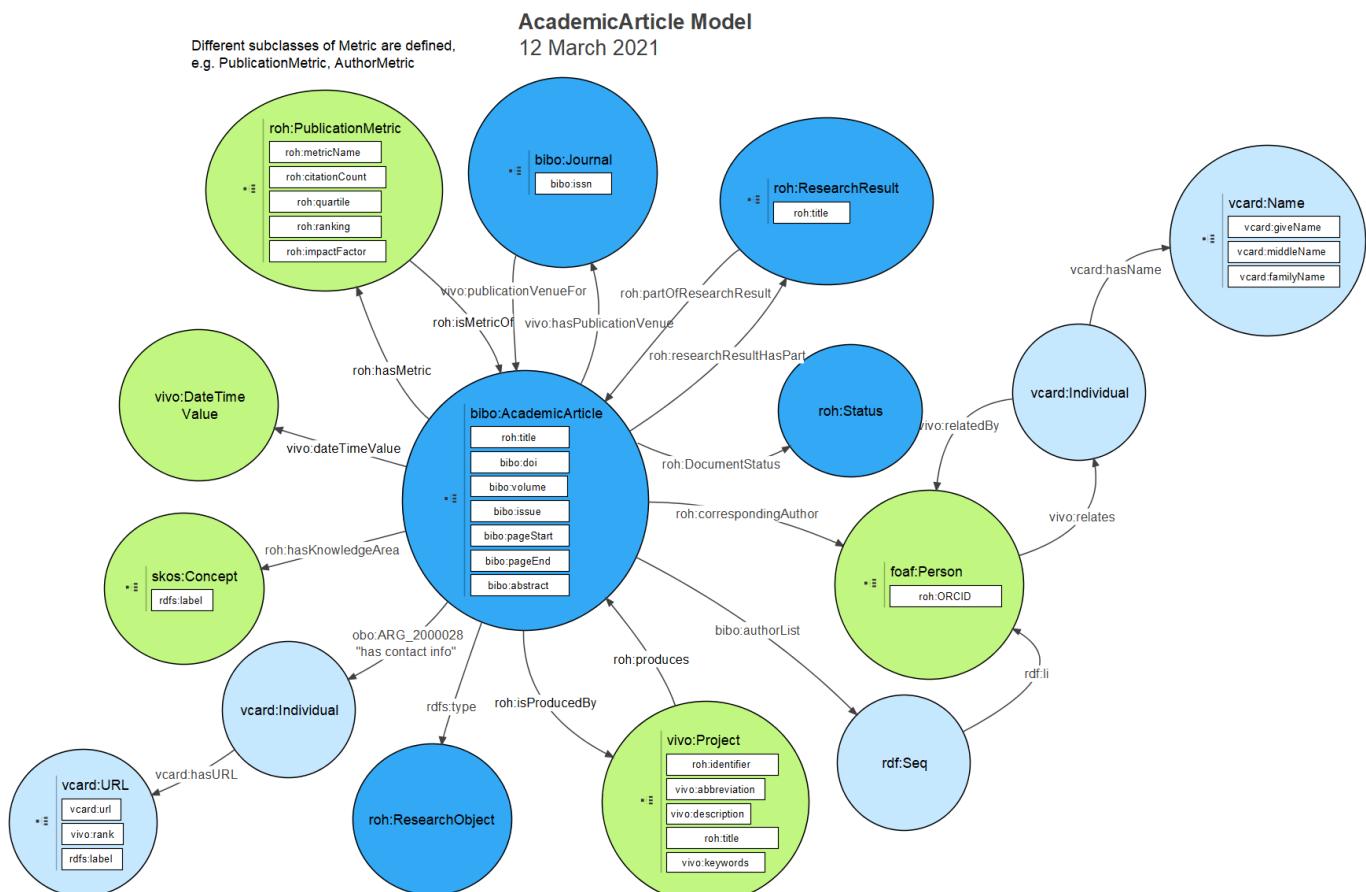

Figure 7. Ontological diagram for AcademicArticle.

Another important sub-entity of `obo-iao: IAO_0000030` (Information Content Entity) is `roh:Repository` (see Figure 8). Documents, pieces of software, experimental protocols or data can be linked to repository (`roh:Repository`) that contains them through the object property `roh:partOfRepository`. `roh:Repository` is associated through `roh:hasSuccessor` with another `roh:Repository` when it is a predecessor or fork of the first one, and through `roh:hasReadme` with the document describing the structure of the repository `roh:README`. This entity can be linked with the contributors through `roh:seqOfAuthors`, to the primary author (`foaf:Person`) through `roh:correspondingAuthor`, to corresponding organization (`foaf:Organization`) through `roh:correspondingOrganization`.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

The following table illustrates the object and data properties associated to entity roh:Repository, which is a subclass of obo-iao: IAO_0000030 (Information Content Entity).

1.7.2. roh:ExperimentalProtocol Entity

The **roh:ExperimentalProtocol** entity (see Figure 9), new in ROH, models the process or protocol to perform an experiment. The **roh:ExperimentalProtocol** entity may be linked to the **roh:ExperimentalProtocolResult** entity, a document that exposes the result of carrying out this process with some concrete data, through **roh:produces**.

The following table illustrates the object and data properties associated to entity **roh:ExperimentalProtocol**.

1.7.3. obo-ero:ERO_0000071 (Software) Entity

The software entity is imported from the obo-ero ontology. Software is associated through roh:hasSuccessor with another roh:software when the latter is based on the first one, and through roh:hasReadme with the document describing the software roh:README. The programming language for a software is expressed through data property roh:programmingLanguage.

The following table illustrates the object and data properties associated to obo-ero:ERO_0000071 (Software) .

Prefix	Class	Prefix	Object property (bold indicates explicit Domain, otherwise a Restriction)	Range Class	Prefix	Datatype Property (bold indicates explicit domain; otherwise a restriction)	Range Datatype (if typed)	Range values

1.8. Activity entity

The entity research activity (**roh:Activity**), new in ROH and visualized in **Error! No se encuentra el origen de la referencia.**, represents the activities in which People participate (**roh:participes**) and organized by Organizations (**foaf:Organization**) reflected through the **roh:hasRole** relationship that connects with the intermediary entity **vivo:OrganizerRole**. Each activity is usually linked to a project through the relationship (**roh:participes**) and causes a project expenditure linked through (**vivo:relates**). A detailed hierarchy of activity subtypes is defined below **roh:Activity**: **bibo:Conference**, **vivo:Course**, **vivo:Internship** or **roh:ThesisViva**.

FONDO EUROPEO DE DESARROLLO REGIONAL (FEDER)

Una manera de hacer Europa

Related to Activity, it is also important to describe roh:Expense, which denotes the expenses incurred either by a project (vivo:Project) or person (foaf:Person) and linked through roh:spends. Every expense has a time instant of associated expense (vivo:DateTimeValue) and other properties that qualify it as (roh:monetaryAmount, roh:currency, roh:title or vivo:description). The following subclasses of roh:Expense have been defined: roh:PatentExpense, roh:PersonExpense, roh:ProjectExpense and roh:ResearchObjectExpense. Besides, each expense can have associated a different type of expense through roh:hasExpenseClassification (Congress/network, external recruitment, Investment/inventory, office, other costs, publication, representation or staff expenses).

The following table illustrates the class hierarchy, object and data properties defined by roh:Activity.
